The paper presents the major barriers to Offsite Construction (OSC) adoption in Jordan from a Triple Bottom Line (TBL) sustainability framework. It also recommends steps to enhance OSC implementation in the Jordanian construction industry.

A quantitative approach was used to generalise findings and draw conclusions. Exploratory Factor Analysis (EFA) was applied to establish relationships between variables and group them into the proposed components based on 208 valid responses from construction professionals in Jordan. EFA and descriptive statistics using SPSS developed a hierarchy of barriers to OSC adoption.

The lack of regulations, standards, and incentives, the lack of adequate labourers, and long lead times and time certainty issues were identified as the three most important variables. At the same time, the uncertainty of energy performance was considered the least important variable affecting the Jordanian OSC sector.

Given that the research focused on OSC adoption in the Jordanian construction industry, and the data was collected from Jordan only, the findings are applicable to the Jordanian context only. This exploratory study highlights implications for further investigations into the barriers to OSC adoption in Jordan.

The anticipated outcome is to help practitioners understand the challenges associated with the low adoption of OSC in Jordan. The identified variables and recommendations can guide strategic decisions, including assessments and benchmarking, fostering OSC development in Jordan.

10  
11 33 **Introduction**  
12  
13  
14 34 The Jordanian construction industry contributes significantly to both the country's  
15 social and economic aspects. It employs 68,135 Jordanians and contributed 4.7% of  
16 the total Gross Domestic Product (GDP) in 2022, amounting to 261 million JOD  
17 (Department of Statistics, 2022; Trading Economics, 2022). However, several  
18 problems within Jordan's traditional construction sector cause risks to the industry's  
19 three aspects of sustainability: economic, social, and environmental, as they have  
20 harmful consequences on natural resources and long-term socioeconomic  
21 circumstances. These include the lack of skilled labour and improper use of building  
22 materials (Yasin & Rjoub, 2017). Al Assaf (2017) advocated the adoption of  
23 sustainable construction methods to enhance the efficiency of the Jordanian  
24 construction industry in response to such issues.  
25  
26  
27  
28  
29  
30  
31  
32  
33 45 OSC is widely acknowledged as a sustainable construction method that addresses  
34 the inefficiencies of conventional construction methods. Wuni and Shen (2019)  
35 argued that the limitations of traditional methods, including high energy consumption  
36 and carbon emissions, are driving the shift towards OSC. In addition, Obi et al.  
37 (2023) concluded that OSC's potential for sustainable value creation is vast. Both  
38 developed and developing nations are motivated by the benefits of OSC to promote  
39 and take the lead in adopting OSC methods. Examples from developed countries  
40 include the UK and Australia's promotion efforts, showcasing diverse strategies to  
41 promote OSC adoption (Nadim & Goulding, 2011). Meanwhile, Hong Kong's  
42 government drives OSC uptake by offering incentives for gross floor area (Tam et  
43 al., 2015).  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53 56 Despite this interest, several countries still need to improve the OSC adoption rates  
54 and make the construction sector more sustainable. For instance, Attouri et al.  
55 (2022) identified the benefits and barriers to OSC adoption in the French  
56 construction sector, where the adoption rate is less than 10%. In Jordan, despite the  
57 lack of governmental reports on the status of OSC, it is evident that its adoption  
58  
59  
60

1  
2  
3 61 remains minimal (AlBalkhy et al., 2021). These low international adoption rates are  
4 62 likely due to several barriers and challenges, such as design inflexibility (Pan et al.,  
5 63 2007), lack of knowledge and experience (Arif et al., 2012), and lack of  
6 64 environmental awareness (Hu et al., 2019).  
7  
8  
9

10  
11 65 Blismas et al. (2005) stated that OSC is impeded by the barriers or the neglect of the  
12 66 benefits. Moreover, Chen et al. (2010) claimed that irrational adoption of OSC leads  
13 67 to change orders, cost overruns, and other significant problems. Although  
14 68 researchers are still looking into the factors that impact the implementation of OSC, a  
15 69 notable gap exists in research concerning OSC in Jordan. Badran et al. (2024)  
16 70 identified the barriers to OSC adoption in Jordan. However, the study did not explore  
17 71 the broader sustainability implications and practical strategies for addressing such  
18 72 barriers. Obi et al. (2023) emphasised that the construction industry has significantly  
19 73 emphasised sustainability to mitigate economic, social, and environmental impacts.  
20 74 Consequently, identifying barriers to OSC adoption in Jordan with a particular  
21 75 emphasis on sustainability considerations becomes crucial for its success.  
22 76 Accordingly, this paper fills the knowledge gap concerning sustainability-based  
23 77 barriers to OSC adoption in Jordan, guided by the TBL theory of sustainability. To  
24 78 achieve this, the paper aims to identify and analyse these barriers and provide  
25 79 practical recommendations, emphasising the importance of addressing them to  
26 80 enhance sustainable practices in the Jordanian construction industry.

## 40 81 Literature Review

41  
42 82 Boosting OSC adoption can be achieved through several prerequisites, including the  
43 83 willingness of clients, organisations, and governments (Guribie et al., 2022). Pan et  
44 84 al. (2007) emphasised the importance of the industry's readiness to adopt OSC.  
45 85 While Blismas and Wakefield (2009) asserted that the lack of guidance hinders OSC  
46 86 implementation, the willingness to implement OSC also impacts the decision-making  
47 87 process (Azhar et al., 2013). Agreeing with them, Rahman (2014) found that the  
48 88 construction industry's mindset impacts the willingness to choose OSC, as  
49 89 construction professionals are not trained to think of mass production and modular  
50 90 design paradigms. It can be argued that governments could impact the decision to  
51 91 adopt OSC and enhance OSC promotion through their policies (Mao et al., 2018). In  
52  
53  
54  
55  
56  
57  
58  
59  
60

92 light of this, it becomes evident that OSC implementation could be promoted through  
93 policies, training, and promotion by government agencies and industry bodies.

94 Barriers associated with OSC are extensively addressed in the existing literature  
95 (Attouri et al., 2022; El-Abidi & Ghazali, 2015; Feldmann et al., 2022). For instance,  
96 Rahman (2014) found cost-related barriers to be the most influential among 26  
97 validated barriers in the UK and China, including higher initial and total costs. Gan et  
98 al. (2018) stressed the significance of influential stakeholders in influencing market  
99 and social barriers, including the lack of social acceptance. Nevertheless, the effect  
100 of OSC on the environment is considered highly beneficial, and most relevant  
101 studies overlooked its environmental barriers. This might be explained by shorter  
102 production and construction times when adopting OSC methods (Feldmann, 2022).

103 Integrating the barriers to OSC with the TBL theory provides a comprehensive  
104 understanding of the economic, social, and environmental barriers. Goh et al. (2020)  
105 advocated for the TBL theory, stating that it should achieve an optimal balance  
106 between the three pillars of sustainable construction. Moreover, the TBL theory was  
107 widely employed in construction and OSC-related studies, such as by Kamali and  
108 Hewage (2017) in their comparison between modular and traditional construction  
109 and Brissi et al. (2021) to cluster the factors affecting the adoption of OSC in the US  
110 housing sector. Hence, this holistic approach is crucial to enhancing sustainable  
111 practices in OSC and achieving socioeconomic and environmental balance within  
112 the OSC industry.

113 Therefore, this study examines the adoption of OSC in Jordan from the TBL  
114 perspective, identifying previously unexplored variables influencing the OSC sector  
115 in the country while accounting for the rarely examined environmental barriers. From  
116 a synthesis of prior research, 18 barriers were identified and systematically  
117 categorised using the TBL theory. These barriers are discussed in the following  
118 subsections.

119 *Economic Barriers*

120 Economic barriers focus on cost, productivity, and risk concerns in the OSC industry  
121 (Brissi et al., 2021). As the decision to implement OSC is predominantly cost-driven  
122 (Blismas et al., 2006), several studies argued that the financial issues of OSC hinder

123 its adoption, including high initial cost (Nadim & Goulding, 2011), high capital cost  
124 (Arif et al., 2012), and cash flow problems (Razkenari et al., 2020). The lack of  
125 transportation and storage solutions also increases the cost of implementing OSC.  
126 This is attributed to the fact that transportation accounts for 6–11% and sometimes  
127 up to 18% of OSC's overall cost (Hong et al., 2018; Lu & Yuan, 2013), in addition to  
128 the challenge of locating adequate storage space, particularly in populated areas  
129 (Choi et al., 2017).

130 Design complexities and standardisation issues are also significant economic  
131 barriers. OSC process efficiency is impacted by the inability to freeze designs early  
132 (Blismas et al., 2005). Pan et al. (2007) maintained that additional management and  
133 design considerations result in longer lead times. Rahman (2014) supported this by  
134 stating that, in some cases, OSC projects require bespoke designs and freezing  
135 designs early to mitigate extensive planning and long lead times. This underscores  
136 the importance of thoroughly considering planning and engineering requirements for  
137 effective OSC adoption (Wuni & Shen, 2020). Furthermore, the lack of  
138 standardisation in some countries is attributed to the lack of design guidance and  
139 codes (Gan et al., 2018). Gan et al. (2018) argued that the lack of suppliers,  
140 manufacturers, or contractors hinders OSC adoption. This can lead to further  
141 logistical and coordination challenges (Pan & Hon, 2020). Bendi et al. (2020) claimed  
142 that the availability of OSC manufacturers and suppliers motivates owners to  
143 implement it, which affirms the importance of the availability of manufacturing  
144 capabilities. Concerning technology, Goulding et al. (2012) emphasised the  
145 significance of technology in boosting OSC use. However, the lack of suitable  
146 technology and equipment is a significant obstacle to OSC in many nations (Marinelli  
147 et al., 2022).

#### 148 *Social Barriers*

149 Social barriers primarily concern the impact of knowledge, quality, labour, and  
150 societal issues on the OSC sector (Brissi et al., 2021). Blismas et al. (2006) argued  
151 that explaining the added value of OSC to stakeholders is a challenge to OSC  
152 adoption. Han and Wang (2018) supported this by declaring that the lack of quality  
153 acceptance is an overt barrier in the Chinese OSC industry. However, to enhance  
154 OSC adoption, it is essential that all stakeholders share a common optimistic

1  
2  
3 155 perspective (Nadim & Goulding, 2011), which is considered a hurdle in countries  
4 156 where the OSC industry is still in its infancy (Bendi et al., 2020). Perspectives on  
5 157 OSC adoption are restricted by scepticism and reluctance to change and innovation.  
6 158 This resistance to change could be explained by the lack of experience and  
7 159 knowledge, with the competency of designers, manufacturers, and contractors'  
8 160 expertise being a crucial success factor (Jung et al., 2021). Although OSC is utilised  
9 161 to improve quality and avoid labour shortages ( Jiang et al., 2020), more skilled and  
10 162 educated workers are still needed (Almutairi et al., 2017; Wuni & Shen, 2020). Thus,  
11 163 investing in continuous professional development, training, and collaboration among  
12 164 all parties is essential to overcome change-averseness and ensure successful OSC  
13 165 implementation.

14  
15 166 Hwang et al. (2018) affirmed that early collaboration is critical in overcoming barriers  
16 167 to implementing OSC. However, OSC has considerable cooperation challenges  
17 168 because of the fragmentation of the construction industry (Marinelli et al., 2022). The  
18 169 absence of laws and guidelines is another barrier in many countries (Arif & Egbu,  
19 170 2010; Zhai et al., 2014). Interestingly, some developed countries have successfully  
20 171 overcome this barrier because of their effective strategies and incentives (Oti-  
21 172 Sarpong et al., 2022), with Singapore's explicit policies and legislative  
22 173 encouragement for OSC advancements as an exemplar (Xu et al., 2020).

23  
24 174 *Environmental Barriers*

25  
26 175 Stakeholders are still dissatisfied with OSC's environmental benefits (Jayawardana  
27 176 et al., 2023), even though OSC is associated with environmental benefits, such as  
28 177 minimising waste and emissions (Yunus & Yang, 2012). Several barriers that hinder  
29 178 the efforts to achieve these benefits have been identified in past research. For  
30 179 instance, Tam et al. (2007) mentioned a lack of environmental awareness by  
31 180 suggesting that enhancing it will facilitate OSC's future adoption. This is further  
32 181 supported by noting that environmental sustainability affects OSC usage  
33 182 (G. Wu et al., 2019), and its absence impedes green building development (Z. Wu et  
34 183 al., 2019). In addition, the lack of effective waste management strategies hinders  
35 184 OSC adoption as their availability is an OSC key performance indicator (Kamali &  
36 185 Hewage, 2016).

1  
2  
3 186 Another environmental challenge is the environmental disruption caused by the  
4 transportation of OSC components and materials to the site, leading to congestion  
5 and disturbance issues (Jaillon & Poon, 2008), which aggravates by site constraints  
6 and access restrictions (Rahman, 2014). The availability of affordable and  
7 environmentally friendly materials is also essential (Wuni & Shen, 2020), as it  
8 alleviates lead times and high costs. In another study, Wuni and Shen (2020)  
9 claimed that OSC's uncertain energy performance is another barrier to its adoption.  
10  
11 191 This supports the argument made by Blismas and Wakefield (2009) that OSC  
12 implementation has no impact on Australia's energy ratings.  
13

18  
19  
20 195 *Overview of the Jordanian Construction Sector and OSC Adoption*  
21  
22  
23 196 Despite the importance of the construction sector in Jordan as one of the key  
24 economic drivers, it suffers from productivity degradation and time and cost overruns  
25 (Shugran & Ghazali, 2024). Moreover, unlike in developing countries where  
26 construction industries benefit from good communication, Jordan's poor  
27 communication limit project performance (Suleiman et al., 2023). Persistent financial  
28 challenges and cultural resistance further hinder the modernisation and the  
29 development of the Jordanian construction sector (Zeadat, 2024). These limitations  
30 point to the need for a systemic shift towards more sustainable construction methods  
31 like OSC.

37  
38  
39 204 OSC is well established for its productivity, efficiency, time, and sustainability  
40 advantages (Brissi & Debs, 2023). Although Jordanian strategic plans advocate  
41 innovation and OSC to address the challenges in the housing sector (JSF, 2019), the  
42 relatively low adoption rate suggests limited effort and commitment from  
43 stakeholders. Additionally, several barriers hinder the uptake of OSC in Jordan,  
44 including high initial cost and a lack of environmental awareness (Badran et al.,  
45 2024). Addressing these challenges requires strategies that balance stakeholder  
46 commitment and industry capability to facilitate OSC adoption in Jordan. Therefore,  
47 this paper aims to address the gap in knowledge regarding OSC adoption in Jordan,  
48 with a specific focus on sustainability-based barriers. Based on the Triple Bottom  
49 Line framework, this research will identify and subsequently analyse those  
50 economic, social, and environmental barriers that act to impede OSC implementation  
51 in Jordan's construction industry. Moreover, this research aims not only to enhance  
52

9  
10 221 **Research Methodology**  
11  
12  
13 222 This study follows a positivist epistemology to identify and analyse the sustainability-  
14 based barriers to OSC adoption in Jordan. This philosophical position assumes that  
15 knowledge can be obtained by rational deduction and quantification. A survey with  
16 participants from a variety of stakeholders is the most appropriate approach to draw  
17 insightful conclusions about these barriers (Fellows & Liu, 2015). Furthermore,  
18 positivism emphasises the use of Likert scale questionnaires to collect quantifiable  
19 data, which makes the study quantitative (Dauda et al., 2024). Hence, this research  
20 utilised a quantitative approach, enabling precise measurement of the identified  
21 variables influencing OSC adoption (Guribie et al., 2022).  
22  
23  
24  
25  
26  
27  
28  
29 231 After designing the questionnaire, validation was done via piloting before its final  
30 distribution. The draft was shared with five respondents from academia and the  
31 industry, and a detailed clarification of the research aim was accompanied. ~~Their~~  
32 ~~feedback led to improving the descriptions of the variables. This pilot survey was~~  
33 ~~conducted to ensure the relevance and clarity of the questionnaire. Feedback~~  
34 ~~indicated that some items were ambiguous or wordy. For example, separate items~~  
35 ~~addressing long lead times and time certainty were consolidated into a single item to~~  
36 ~~reflect their correlation in practice. Therefore, the item was refined to “Reducing lead~~  
37 ~~times and improving time certainty” to better capture schedule reliability and efficacy.~~  
38 ~~The refinements enhanced the overall flow and clarity of the questionnaire.~~  
39  
40  
41  
42  
43  
44  
45  
46  
47 241 Ethical approval for the study was obtained from the relevant institutional committee,  
48 and informed consents were secured from all respondents. The questionnaire  
49 comprised five sections covering general participant information, economic barriers,  
50 social barriers, environmental barriers, and the determinates of OSC adoption. The  
51 selection criteria focused on having knowledge or experience in the Jordanian  
52 construction sector, and having prior experience in OSC was not mandatory. Similar  
53 studies, such as those by Marinelli et al. (2022), chose these requirements based on  
54 low OSC adoption rates. ~~Although participants' experience was reported in the~~  
55  
56  
57  
58  
59  
60

1  
2  
3 249 construction industry generally, all participants were familiar with OSC concepts  
4 (e.g., precast elements). Therefore, given that OSC in Jordan is still in its infancy,  
5 general construction experience served as a reasonable proxy for relevant  
6 experience.

60

253 A purposive non-probability sampling technique was employed because it was  
254 difficult to determine the exact number of construction professionals in Jordan. The  
255 snowball sampling technique was used in numerous OSC-related studies due to the  
256 global spread and the absence of sampling frames (Guribie et al., 2022; Mao et al.,  
257 2018. The impracticability of probability-based approaches in construction research  
258 was another factor, which could result in an unreasonably low response rate  
259 (Abowits & Toole, 2010). Hence, snowball sampling was the most practical  
260 technique to achieve sufficient responses from construction professionals. The  
261 questionnaire was administered online to mitigate the biases often associated with  
262 in-person surveys. A total of 208 responses were collected from 04/May/2023 to  
263 20/July/2023. The respondents were asked to rate the importance of each indicator  
264 in Table 1 on a 5-point Likert scale, ranging from extremely unimportant to extremely  
265 important. The demographic profile of the respondents is summarised in Table 2.

#### **\*\*\* INSERT TABLE II HERE \*\*\***

266  
267 The data was analysed using SPSS v29. Exploratory Factor Analysis (EFA) was  
268 conducted to assess the distribution of the variables among the four proposed  
269 factors (i.e., economic barriers, social barriers, environmental barriers, and OSC  
270 adoption) as a researcher may determine a specific number of groups based on  
271 previous research or theoretical considerations (Hair et al., 2011; Hwang & Choe,  
272 2020; Leeman et al., 2022). Therefore, the researcher forced the number of factors  
273 to four and embraced Principal Component Analysis (PCA) and Varimax rotation  
274 techniques to perform the analysis. Factor loadings greater than 0.4 indicated  
275 significant relationships between the extracted components. Cronbach's alpha,  
276 Kaiser-Meyer-Olkin (KMO), and Bartlett Test of Sphericity were employed to assess  
277 the reliability of the extracted factors.

## **278 Results and Analysis**

1  
2  
3 279 The four extracted groups in Table 3 explained approximately 65% of the variation.  
4  
5 280 Five variables played multiple roles and contributed to two components, indicating a  
6 complex relationship between the foundational concepts. Rahman (2014) attributed  
7 the various roles of some barriers to OSC adoption to their interrelations, highlighting  
8 the need for a comprehensive and unified approach to address these barriers.  
9  
10 284 Moreover, the five cross-loading variables had communalities above 0.5, leading to  
11 disregarding their cross-loading (Kim & Im, 2023). Thus, these variables are not  
12 independent but have similarities corresponding with these unique elements.  
13  
14 286  
15  
16

17  
18 287 **\*\*\* INSERT TABLE III HERE \*\*\***  
19  
20

21 288 Cronbach's alpha test was performed to assess the reliability of the components.  
22  
23 289 With a minimum value of 0.779, the four components were considered to have  
24 acceptable to excellent internal consistency (George & Mallery, 2019). KMO and  
25 Bartlett Test of Sphericity were also conducted to examine the correlations among  
26 variables and their occurrence (Hair et al., 2018). A KMO value closer to one and the  
27 significance of the Bartlett Test of Sphericity indicate that a highly reliable scale is  
28 present. The results of these tests are summarised in Table 4.  
29  
30  
31 294  
32

33  
34 295 **\*\*\* INSERT TABLE IV HERE \*\*\***  
35  
36

37 296 After the exploratory factor analysis, the descriptive statistics for the variables  
38 analysed are presented in Table 5. These results include the number of  
39 respondents, as well as the mean and standard deviation. The analysis indicates  
40 that the most significant variable is the 'Lack of regulations, standards, and  
41 incentives' (mean = 4.09). Additionally, the lowest mean score is 3.77, which  
42 indicates that all variables are considered important in the context of OSC in Jordan.

## 51 303 **Discussion**

52  
53

54 304 The literature review and data analysis revealed the key barriers significantly  
55 influencing the adoption of OSC. The factor analysis rearranged the 23 variables  
56 based on the TBL of sustainability theory into four predefined groups: OSC adoption,  
57  
58  
59  
60

307 economic barriers, social barriers, and environmental barriers. The 23 variables are  
 308 grouped as shown in Figure 1.

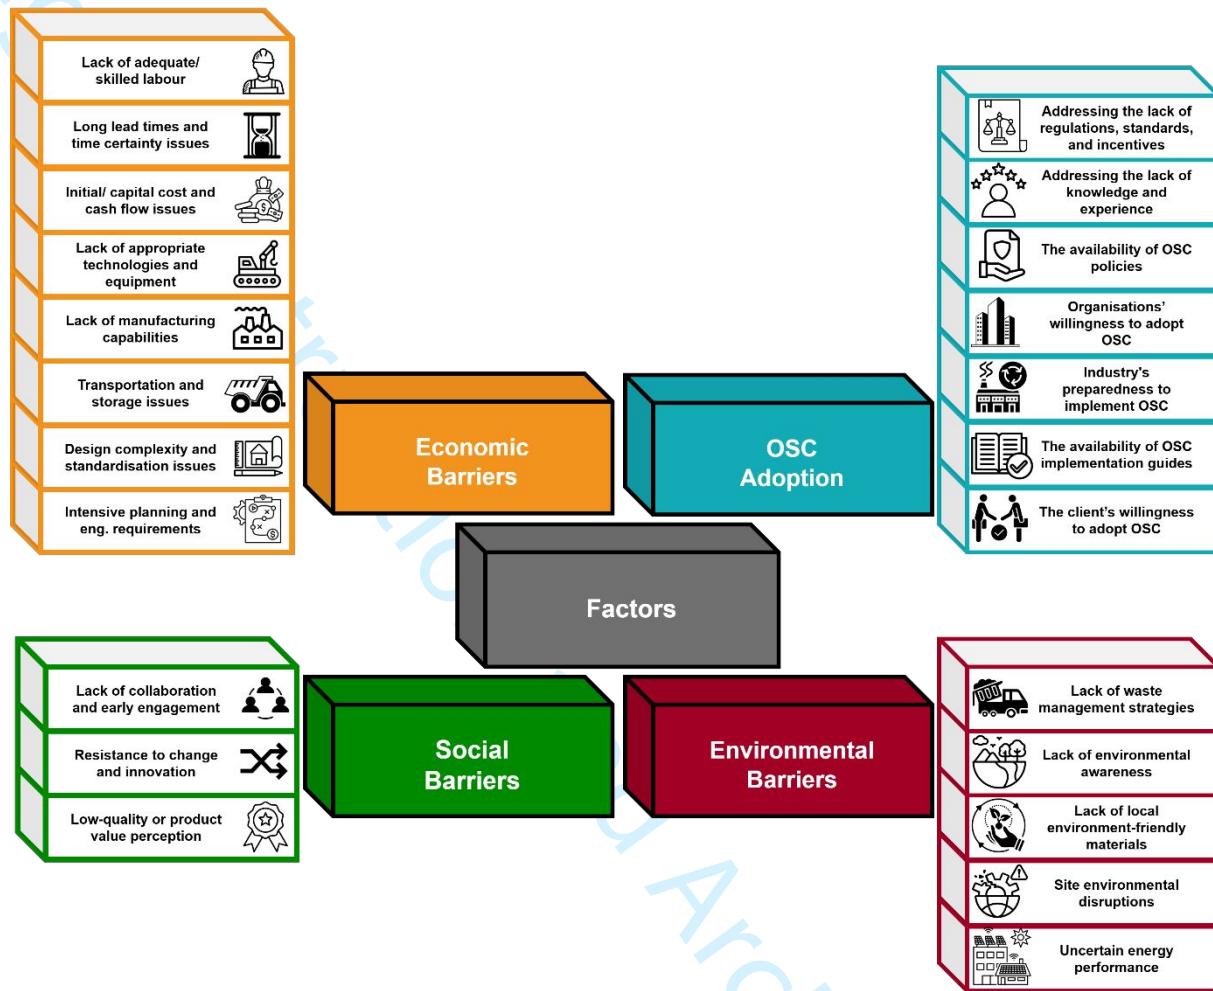

Figure 1: Results of Factor Analysis

### 311 *Economic Barriers*

312 The first factor, named economic barriers, has eight barriers. The initial/capital cost  
 313 and cash flow issues barrier is considered a substantial barrier to OSC adoption in  
 314 Jordan. One reason for this is the interdependency of construction sectors with  
 315 countries' financial aspects (Dabirian et al., 2023). This is also closely linked to the  
 316 complexity of decision-making and the extensive planning and engineering  
 317 requirements. Another economic barrier is the intensive planning and engineering  
 318 requirements that are intertwined with social barriers and concerns about integration  
 319 and early engagement of all parties. This is supported by Gibb and Isack (2003),  
 320 who asserted that OSC might not be effective without the early engagement of the  
 321 suppliers and design freeze. This means that addressing the economic barriers

1  
2  
3 322 requires a comprehensive approach that integrates both economic and social  
4 challenges.  
5  
6

7 324 Another important economic aspect is the late freezing of design, which is integral to  
8 the design complexity and standardisation issues barrier. This is because it can then  
9 result in client satisfaction and trust issues. This confirms that freezing design early  
10 is a considerable advantage of OSC (Tam et al., 2007). This is crucial in the  
11 Jordanian context, as design changes are significantly affected by client  
12 requirements and design errors (Gharaibeh et al., 2020). The design time and design  
13 freezing sub-variables also correlate with the long lead times and time certainty  
14 issues barrier, as OSC has different relationships and concurrencies between  
15 construction activities compared to traditional construction methods. Wuni and Shen  
16 (2019) reported similar findings when they found that the design variable is highly  
17 correlated with time and quality variables. Hence, addressing design-related barriers  
18 ultimately leads to more accurate project timelines and improves OSC outcomes.  
19  
20

21 336 The lack of manufacturing capabilities also adds to the economic group of barriers.  
22 337 Establishing manufacturing capabilities requires significant investment and evidence  
23 of achieving economies of scale. Another reason for the lack of manufacturing  
24 capabilities is the lack of appropriate technologies and equipment, as implementing  
25 OSC methods requires a sophisticated integration of various technologies and  
26 manufacturing techniques (Goulding et al., 2023). In Jordan, this is closely linked to  
27 the slow technological adoption, as the country lacks experience and is suffering  
28 from high training and software costs (Hyarat et al., 2022). Moreover, transportation  
29 and storage issues exacerbate the integration of technologies and manufacturing  
30 techniques by restricting the dimensions of the transported elements and the ability  
31 to store them. This is particularly common in developing countries, where logistical  
32 solutions are more challenging (Jiang et al., 2018). Therefore, investments in  
33 advanced technologies and strategic planning are essential for addressing logistical  
34 challenges, particularly in developing countries.  
35  
36

37 350 Furthermore, although OSC is well-known for addressing labour shortage issues, the  
38 lack of adequate labour compounds challenges to adopting OSC. This is because  
39 OSC demands more expertise from workers than traditional construction methods  
40 (Almutairi et al., 2017). This considerably constraints timelines and productivity rates,  
41  
42

1  
2  
3 354 affecting projects' total costs. Hence, adopting a strategic approach to optimising  
4 resource allocation and streamlining processes in Jordan's OSC landscape is  
5 essential to addressing the economic barriers and enhancing sustainability.  
6  
7  
8  
9 357 *Social Barriers*  
10  
11  
12 358 The second factor, social barriers, included three barriers: quality perception,  
13 resistance to change, and collaboration issues confronting the OSC sector. The low-  
14 quality or product value perception barrier can be attributed to the negative  
15 experience left by previously executed OSC projects that were poorly managed. This  
16 negative image from past failures makes it more challenging to assess OSC's  
17 superiority, contributing substantially to resistance to change and innovation.  
18  
19 362 Addressing these barriers demands well-defined strategies addressing low-value  
20 perceptions and a culture of cooperation (Nadim & Goulding, 2011). Furthermore,  
21 the literature review suggested that early collaboration would mitigate several  
22 barriers to OSC adoption. For instance, Ezcan and Goulding (2022) revealed that a  
23 change in the overall mindset is essential for the sustainability of OSC. This is also  
24 consistent with that of Thneibat and Al-Shattarat (2021), who found that client  
25 support and team environment are key to value management processes in Jordan.  
26  
27 367 Thus, it is imperative to increase stakeholder cooperation and publicise OSC's  
28 quality advantages to increase its adoption.  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39 373 *Environmental Barriers*  
40  
41  
42 374 The third factor constitutes environmental barriers. Addressing these barriers to OSC  
43 adoption is critical for sustainable development. In this context, the lack of  
44 environmental awareness leads to neglecting sustainable practices. On the other  
45 hand, boosting such awareness drives OSC markets to be more mature (Yuan et al.,  
46 2022). Also, the lack of waste management strategies leads to increased  
47 environmental degradation, worsening the adverse environmental impact of  
48 construction. While OSC produces a smaller amount of waste compared to  
49 conventional on-site construction (Kamali & Hewage, 2017), inadequate waste  
50 management strategies can lead to higher disposal expenses and potential  
51 environmental damage. These barriers reflect a wider issue in Jordan, where  
52 environmental principles are less emphasised in government construction projects  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 385 (Ayoub et al., 2023). Therefore, enhancing environmental awareness and  
4 implementing effective waste management strategies are essential steps towards  
5 fostering a more sustainable and mature OSC market.  
6  
7

8  
9 388 The uncertain energy performance calls into question the long-term sustainability  
10 efficiency of OSC projects. This finding is consistent with that of Wuni and Shen  
11 (2020), who found that the uncertainties about the energy performance of OSC  
12 projects are an important technical barrier. Moreover, while the limited availability of  
13 local eco-friendly materials increases emissions and transport costs, it can also  
14 contribute to site disruptions during OSC activities. Hence, addressing these barriers  
15 provides myriad advantages for the Jordanian construction industry, as it can lead to  
16 significant economic and social benefits.  
17  
18

19 396 *OSC Adoption*  
20  
21

22  
23 397 The fourth factor is OSC adoption, which covers the variables that affect the mindset  
24 of the industry in adopting OSC methods. Interestingly, it is deemed that addressing  
25 the lack of knowledge, experience, and the lack of regulations, standards, and  
26 incentives is a prerequisite to adopting OSC rather than a barrier. This result  
27 provides additional support for the perception that knowledge and experience are  
28 essential for the efficient management of OSC projects (Ginigaddara et al., 2023;  
29 Jang et al., 2021). By recognising these aspects as foundational prerequisites,  
30 stakeholders can focus on enhancing other variables, smoothening a sustainable  
31 OSC adoption in the Jordanian construction industry. The importance of addressing  
32 the lack of regulations, standards, and incentives is further underlined by being the  
33 most crucial variable affecting OSC adoption in Jordan.  
34  
35

36 408 The other five variables, namely, the client's willingness to adopt OSC, the  
37 organisation's willingness to adopt OSC, the availability of OSC policies, the  
38 availability of OSC implementation guides, and the industry's preparedness to  
39 implement OSC, are in line with previous results (Guribie et al., 2022). In this  
40 context, Goulding et al. (2012) emphasised the need to retrain construction  
41 professionals and clients to adopt a fresh mindset. Such a new mindset can  
42 maximise the potential of realising OSC's advantages and help overcome the  
43 challenges associated with its adoption. This demonstrates that creating a proactive  
44  
45

1  
2  
3 416 mindset and empowering both professionals and clients with the requisite knowledge  
4 417 and resources are critical to improving OSC adoption in Jordan. As a result, the  
5 418 benefits of OSC can be realised, positioning the sector better to address associated  
6 419 barriers.  
7  
8  
9

10  
11 420 **Conclusion**  
12  
13

14 421 This study aimed to identify the barriers to adopting OSC in Jordan through a  
15 422 sustainability-based perspective, employing the TBL sustainability framework. By  
16 423 collecting data from 208 construction professionals in Jordan and applying EFA, the  
17 424 study refined global variables into four context-specific factors: OSC adoption,  
18 425 economic barriers, social barriers, and environmental barriers. These factors  
19 426 illustrate how the pillars of sustainability are shaping the adoption of the OSC in the  
20 427 Jordanian context. A notable finding is that Jordanian construction professionals  
21 428 view addressing the absence of regulations, standards, and incentives, and the  
22 429 absence of knowledge and experience as essential requirements for OSC adoption  
23 430 rather than barriers to it, underscoring a proactive stance within the industry.  
24 431 Moreover, the statistical analysis revealed that the most crucial variable affecting  
25 432 OSC's adoption was the lack of regulations, standards, and incentives. The second  
26 433 and third most important variables were the lack of adequate labour and long lead  
27 434 times and time certainty issues, respectively. Among other variables, the least  
28 435 essential variable was addressing the uncertainty of energy performance.

60

436 The research recognises the importance of addressing economic barriers, given the  
437 cost-driven nature of construction industry decisions. The results confirm that the  
438 economic barriers are the most prevalent sustainability-based barriers to OSC  
439 adoption in Jordan. Hence, optimising resource allocation and implementing value  
440 management practices are crucial for addressing these barriers. Also, adopting a  
441 new mindset that allows for early collaboration between stakeholders to ensure  
442 smooth process coordination is key to realising the advantages of OSC and helping  
443 address the barriers to its adoption. Furthermore, enabling a culture of early  
444 stakeholder collaboration is essential for improving process coordination and  
445 leveraging the benefits of OSC, which supports the social component of the TBL  
446 framework.

1  
2  
3 447 Overall, this research achieves its aim by providing a clear understanding of  
4 448 sustainability-related barriers to OSC adoption in Jordan and by offering practical  
5 449 insights to improve its uptake. The insights gained from this research should assist  
6 450 Jordanian construction organisations in understanding the fundamental requirements  
7 451 for sustainable OSC adoption. The study significantly contributes to the  
8 452 understanding of OSC adoption, as previous research has not identified these  
9 453 factors within the Jordanian OSC sector. Although the findings of this research are  
10 454 significant, its reliance solely on data collected from Jordan limits the generalisability  
11 455 of these findings. Hence, future studies should expand the research to include  
12 456 various geographical contexts and explore additional factors that may impact OSC  
13 457 adoption across different regions. Such an approach would offer a broader  
14 458 understanding of the challenges and opportunities related to OSC, helping to  
15 459 formulate more effective strategies for promoting sustainable construction practices  
16 460 globally.

## 2 Sustainability-Based Barriers to Adopting Offsite Construction in

## 3 Jordan

## 4

### 5 3 Abstract

### 6

7 4 **Purpose**—The paper presents the major barriers to Offsite Construction (OSC)  
8 adoption in Jordan from a Triple Bottom Line (TBL) sustainability framework. It also  
9 recommends steps to enhance OSC implementation in the Jordanian construction  
10 industry.

11 8 **Design/methodology/approach**— A quantitative approach was used to generalise  
12 findings and draw conclusions. Exploratory Factor Analysis (EFA) was applied to  
13 establish relationships between variables and group them into the proposed  
14 components based on 208 valid responses from construction professionals in  
15 Jordan. EFA and descriptive statistics using SPSS developed a hierarchy of barriers  
16 to OSC adoption.

17 14 **Findings**— The lack of regulations, standards, and incentives, the lack of adequate  
18 labourers, and long lead times and time certainty issues were identified as the three  
19 most important variables. At the same time, the uncertainty of energy performance  
20 was considered the least important variable affecting the Jordanian OSC sector.

21 18 **Research limitations/implications**— Given that the research focused on OSC  
22 adoption in the Jordanian construction industry, and the data was collected from  
23 Jordan only, the findings are applicable to the Jordanian context only. This  
24 exploratory study highlights implications for further investigations into the barriers to  
25 OSC adoption in Jordan.

26 23 **Practical implications**— The anticipated outcome is to help practitioners  
27 understand the challenges associated with the low adoption of OSC in Jordan. The  
28 identified variables and recommendations can guide strategic decisions, including  
29 assessments and benchmarking, fostering OSC development in Jordan.

30 27 **Originality/value**— This research identifies barriers to OSC adoption in Jordan and  
31 offers unique insights into the variables that hinder OSC uptake from a sustainability  
32 perspective.

10  
11 33 **Introduction**

12  
13 34 The Jordanian construction industry contributes significantly to both the country's  
14 social and economic aspects. It employs 68,135 Jordanians and contributed 4.7% of  
15 the total Gross Domestic Product (GDP) in 2022, amounting to 261 million JOD  
16 (Department of Statistics, 2022; Trading Economics, 2022). However, several  
17 problems within Jordan's traditional construction sector cause risks to the industry's  
18 three aspects of sustainability: economic, social, and environmental, as they have  
19 harmful consequences on natural resources and long-term socioeconomic  
20 circumstances. These include the lack of skilled labour and improper use of building  
21 materials (Yasin & Rjoub, 2017). Al Assaf (2017) advocated the adoption of  
22 sustainable construction methods to enhance the efficiency of the Jordanian  
23 construction industry in response to such issues.  
24  
25  
26  
27  
28  
29  
30  
31

32  
33 45 OSC is widely acknowledged as a sustainable construction method that addresses  
34 the inefficiencies of conventional construction methods. Wuni and Shen (2019)  
35 argued that the limitations of traditional methods, including high energy consumption  
36 and carbon emissions, are driving the shift towards OSC. In addition, Obi et al.  
37 (2023) concluded that OSC's potential for sustainable value creation is vast. Both  
38 developed and developing nations are motivated by the benefits of OSC to promote  
39 and take the lead in adopting OSC methods. Examples from developed countries  
40 include the UK and Australia's promotion efforts, showcasing diverse strategies to  
41 promote OSC adoption (Nadim & Goulding, 2011). Meanwhile, Hong Kong's  
42 government drives OSC uptake by offering incentives for gross floor area (Tam et  
43 al., 2015).  
44  
45  
46  
47  
48  
49  
50  
51

52  
53 56 Despite this interest, several countries still need to improve the OSC adoption rates  
54 and make the construction sector more sustainable. For instance, Attouri et al.  
55 (2022) identified the benefits and barriers to OSC adoption in the French  
56 construction sector, where the adoption rate is less than 10%. In Jordan, despite the  
57 lack of governmental reports on the status of OSC, it is evident that its adoption  
58  
59  
60

1  
2  
3 61 remains minimal (AlBalkhy et al., 2021). These low international adoption rates are  
4 62 likely due to several barriers and challenges, such as design inflexibility (Pan et al.,  
5 63 2007), lack of knowledge and experience (Arif et al., 2012), and lack of  
6 64 environmental awareness (Hu et al., 2019).  
7  
8  
9

10  
11 65 Blismas et al. (2005) stated that OSC is impeded by the barriers or the neglect of the  
12 66 benefits. Moreover, Chen et al. (2010) claimed that irrational adoption of OSC leads  
13 67 to change orders, cost overruns, and other significant problems. Although  
14 68 researchers are still looking into the factors that impact the implementation of OSC, a  
15 69 notable gap exists in research concerning OSC in Jordan. Badran et al. (2024)  
16 70 identified the barriers to OSC adoption in Jordan. However, the study did not explore  
17 71 the broader sustainability implications and practical strategies for addressing such  
18 72 barriers. Obi et al. (2023) emphasised that the construction industry has significantly  
19 73 emphasised sustainability to mitigate economic, social, and environmental impacts.  
20 74 Consequently, identifying barriers to OSC adoption in Jordan with a particular  
21 75 emphasis on sustainability considerations becomes crucial for its success.  
22 76 Accordingly, this paper fills the knowledge gap concerning sustainability-based  
23 77 barriers to OSC adoption in Jordan, guided by the TBL theory of sustainability. To  
24 78 achieve this, the paper aims to identify and analyse these barriers and provide  
25 79 practical recommendations, emphasising the importance of addressing them to  
26 80 enhance sustainable practices in the Jordanian construction industry.

## 40 81 Literature Review

  
41

42 82 Boosting OSC adoption can be achieved through several prerequisites, including the  
43 83 willingness of clients, organisations, and governments (Guribie et al., 2022). Pan et  
44 84 al. (2007) emphasised the importance of the industry's readiness to adopt OSC.  
45 85 While Blismas and Wakefield (2009) asserted that the lack of guidance hinders OSC  
46 86 implementation, the willingness to implement OSC also impacts the decision-making  
47 87 process (Azhar et al., 2013). Agreeing with them, Rahman (2014) found that the  
48 88 construction industry's mindset impacts the willingness to choose OSC, as  
49 89 construction professionals are not trained to think of mass production and modular  
50 90 design paradigms. It can be argued that governments could impact the decision to  
51 91 adopt OSC and enhance OSC promotion through their policies (Mao et al., 2018). In  
52  
53  
54  
55  
56  
57  
58  
59  
60

92 light of this, it becomes evident that OSC implementation could be promoted through  
93 policies, training, and promotion by government agencies and industry bodies.

94 Barriers associated with OSC are extensively addressed in the existing literature  
95 (Attouri et al., 2022; El-Abidi & Ghazali, 2015; Feldmann et al., 2022). For instance,  
96 Rahman (2014) found cost-related barriers to be the most influential among 26  
97 validated barriers in the UK and China, including higher initial and total costs. Gan et  
98 al. (2018) stressed the significance of influential stakeholders in influencing market  
99 and social barriers, including the lack of social acceptance. Nevertheless, the effect  
100 of OSC on the environment is considered highly beneficial, and most relevant  
101 studies overlooked its environmental barriers. This might be explained by shorter  
102 production and construction times when adopting OSC methods (Feldmann, 2022).

Integrating the barriers to OSC with the TBL theory provides a comprehensive understanding of the economic, social, and environmental barriers. Goh et al. (2020) advocated for the TBL theory, stating that it should achieve an optimal balance between the three pillars of sustainable construction. Moreover, the TBL theory was widely employed in construction and OSC-related studies, such as by Kamali and Hewage (2017) in their comparison between modular and traditional construction and Brissi et al. (2021) to cluster the factors affecting the adoption of OSC in the US housing sector. Hence, this holistic approach is crucial to enhancing sustainable practices in OSC and achieving socioeconomic and environmental balance within the OSC industry.

113 Therefore, this study examines the adoption of OSC in Jordan from the TBL  
114 perspective, identifying previously unexplored variables influencing the OSC sector  
115 in the country while accounting for the rarely examined environmental barriers. From  
116 a synthesis of prior research, 18 barriers were identified and systematically  
117 categorised using the TBL theory. These barriers are discussed in the following  
118 subsections.

119 *Economic Barriers*

120 Economic barriers focus on cost, productivity, and risk concerns in the OSC industry  
121 (Brissi et al., 2021). As the decision to implement OSC is predominantly cost-driven  
122 (Blismas et al., 2006), several studies argued that the financial issues of OSC hinder

123 its adoption, including high initial cost (Nadim & Goulding, 2011), high capital cost  
124 (Arif et al., 2012), and cash flow problems (Razkenari et al., 2020). The lack of  
125 transportation and storage solutions also increases the cost of implementing OSC.  
126 This is attributed to the fact that transportation accounts for 6–11% and sometimes  
127 up to 18% of OSC's overall cost (Hong et al., 2018; Lu & Yuan, 2013), in addition to  
128 the challenge of locating adequate storage space, particularly in populated areas  
129 (Choi et al., 2017).

130 Design complexities and standardisation issues are also significant economic  
131 barriers. OSC process efficiency is impacted by the inability to freeze designs early  
132 (Blismas et al., 2005). Pan et al. (2007) maintained that additional management and  
133 design considerations result in longer lead times. Rahman (2014) supported this by  
134 stating that, in some cases, OSC projects require bespoke designs and freezing  
135 designs early to mitigate extensive planning and long lead times. This underscores  
136 the importance of thoroughly considering planning and engineering requirements for  
137 effective OSC adoption (Wuni & Shen, 2020). Furthermore, the lack of  
138 standardisation in some countries is attributed to the lack of design guidance and  
139 codes (Gan et al., 2018). Gan et al. (2018) argued that the lack of suppliers,  
140 manufacturers, or contractors hinders OSC adoption. This can lead to further  
141 logistical and coordination challenges (Pan & Hon, 2020). Bendi et al. (2020) claimed  
142 that the availability of OSC manufacturers and suppliers motivates owners to  
143 implement it, which affirms the importance of the availability of manufacturing  
144 capabilities. Concerning technology, Goulding et al. (2012) emphasised the  
145 significance of technology in boosting OSC use. However, the lack of suitable  
146 technology and equipment is a significant obstacle to OSC in many nations (Marinelli  
147 et al., 2022).

#### 148 *Social Barriers*

149 Social barriers primarily concern the impact of knowledge, quality, labour, and  
150 societal issues on the OSC sector (Brissi et al., 2021). Blismas et al. (2006) argued  
151 that explaining the added value of OSC to stakeholders is a challenge to OSC  
152 adoption. Han and Wang (2018) supported this by declaring that the lack of quality  
153 acceptance is an overt barrier in the Chinese OSC industry. However, to enhance  
154 OSC adoption, it is essential that all stakeholders share a common optimistic

1  
2  
3 155 perspective (Nadim & Goulding, 2011), which is considered a hurdle in countries  
4 156 where the OSC industry is still in its infancy (Bendi et al., 2020). Perspectives on  
5 157 OSC adoption are restricted by scepticism and reluctance to change and innovation.  
6 158 This resistance to change could be explained by the lack of experience and  
7 159 knowledge, with the competency of designers, manufacturers, and contractors'  
8 160 expertise being a crucial success factor (Jung et al., 2021). Although OSC is utilised  
9 161 to improve quality and avoid labour shortages ( Jiang et al., 2020), more skilled and  
10 162 educated workers are still needed (Almutairi et al., 2017; Wuni & Shen, 2020). Thus,  
11 163 investing in continuous professional development, training, and collaboration among  
12 164 all parties is essential to overcome change-averseness and ensure successful OSC  
13 165 implementation.

14  
15 166 Hwang et al. (2018) affirmed that early collaboration is critical in overcoming barriers  
16 167 to implementing OSC. However, OSC has considerable cooperation challenges  
17 168 because of the fragmentation of the construction industry (Marinelli et al., 2022). The  
18 169 absence of laws and guidelines is another barrier in many countries (Arif & Egbu,  
19 170 2010; Zhai et al., 2014). Interestingly, some developed countries have successfully  
20 171 overcome this barrier because of their effective strategies and incentives (Oti-  
21 172 Sarpong et al., 2022), with Singapore's explicit policies and legislative  
22 173 encouragement for OSC advancements as an exemplar (Xu et al., 2020).

23  
24 174 *Environmental Barriers*

25  
26 175 Stakeholders are still dissatisfied with OSC's environmental benefits (Jayawardana  
27 176 et al., 2023), even though OSC is associated with environmental benefits, such as  
28 177 minimising waste and emissions (Yunus & Yang, 2012). Several barriers that hinder  
29 178 the efforts to achieve these benefits have been identified in past research. For  
30 179 instance, Tam et al. (2007) mentioned a lack of environmental awareness by  
31 180 suggesting that enhancing it will facilitate OSC's future adoption. This is further  
32 181 supported by noting that environmental sustainability affects OSC usage  
33 182 (G. Wu et al., 2019), and its absence impedes green building development (Z. Wu et  
34 183 al., 2019). In addition, the lack of effective waste management strategies hinders  
35 184 OSC adoption as their availability is an OSC key performance indicator (Kamali &  
36 185 Hewage, 2016).

1  
2  
3 186 Another environmental challenge is the environmental disruption caused by the  
4 transportation of OSC components and materials to the site, leading to congestion  
5 and disturbance issues (Jaillon & Poon, 2008), which aggravates by site constraints  
6 and access restrictions (Rahman, 2014). The availability of affordable and  
7 environmentally friendly materials is also essential (Wuni & Shen, 2020), as it  
8 alleviates lead times and high costs. In another study, Wuni and Shen (2020)  
9 claimed that OSC's uncertain energy performance is another barrier to its adoption.  
10  
11 191 This supports the argument made by Blismas and Wakefield (2009) that OSC  
12 implementation has no impact on Australia's energy ratings.  
13  
14  
15  
16  
17  
18  
19  
20 195 *Overview of the Jordanian Construction Sector and OSC Adoption*  
21  
22  
23 196 Despite the importance of the construction sector in Jordan as one of the key  
24 economic drivers, it suffers from productivity degradation and time and cost overruns  
25 (Shugran & Ghazali, 2024). Moreover, unlike in developing countries where  
26 construction industries benefit from good communication, Jordan's poor  
27 communication limit project performance (Suleiman et al., 2023). Persistent financial  
28 challenges and cultural resistance further hinder the modernisation and the  
29 development of the Jordanian construction sector (Zeadat, 2024). These limitations  
30 point to the need for a systemic shift towards more sustainable construction methods  
31 202 like OSC.  
32  
33  
34  
35  
36  
37  
38  
39 205 OSC is well established for its productivity, efficiency, time, and sustainability  
40 advantages (Brissi & Debs, 2023). Although Jordanian strategic plans advocate  
41 innovation and OSC to address the challenges in the housing sector (JSF, 2019), the  
42 relatively low adoption rate suggests limited effort and commitment from  
43 stakeholders. Additionally, several barriers hinder the uptake of OSC in Jordan,  
44 including high initial cost and a lack of environmental awareness (Badran et al.,  
45 2024). Addressing these challenges requires strategies that balance stakeholder  
46 commitment and industry capability to facilitate OSC adoption in Jordan. Therefore,  
47 this paper aims to address the gap in knowledge regarding OSC adoption in Jordan,  
48 with a specific focus on sustainability-based barriers. Based on the Triple Bottom  
49 Line framework, this research will identify and subsequently analyse those  
50 economic, social, and environmental barriers that act to impede OSC implementation  
51 in Jordan's construction industry. Moreover, this research aims not only to enhance  
52  
53  
54  
55  
56  
57  
58  
59

9  
10 221 **Research Methodology**  
11  
12  
13 222 This study follows a positivist epistemology to identify and analyse the sustainability-  
14 based barriers to OSC adoption in Jordan. This philosophical position assumes that  
15 knowledge can be obtained by rational deduction and quantification. A survey with  
16 participants from a variety of stakeholders is the most appropriate approach to draw  
17 insightful conclusions about these barriers (Fellows & Liu, 2015). Furthermore,  
18 positivism emphasises the use of Likert scale questionnaires to collect quantifiable  
19 data, which makes the study quantitative (Dauda et al., 2024). Hence, this research  
20 utilised a quantitative approach, enabling precise measurement of the identified  
21 variables influencing OSC adoption (Guribie et al., 2022).  
22  
23  
24  
25  
26  
27  
28  
29 231 After designing the questionnaire, validation was done via piloting before its final  
30 distribution. The draft was shared with five respondents from academia and the  
31 industry, and a detailed clarification of the research aim was accompanied. This pilot  
32 survey was conducted to ensure the relevance and clarity of the questionnaire.  
33  
34 235 Feedback indicated that some items were ambiguous or wordy. For example,  
35 separate items addressing long lead times and time certainty were consolidated into  
36 a single item to reflect their correlation in practice. Therefore, the item was refined to  
37 “Reducing lead times and improving time certainty” to better capture schedule  
38 reliability and efficacy. The refinements enhanced the overall flow and clarity of the  
39 questionnaire.  
40  
41  
42  
43  
44  
45  
46  
47  
48 241 Ethical approval for the study was obtained from the relevant institutional committee,  
49 and informed consents were secured from all respondents. The questionnaire  
50 comprised five sections covering general participant information, economic barriers,  
51 social barriers, environmental barriers, and the determinates of OSC adoption. The  
52 selection criteria focused on having knowledge or experience in the Jordanian  
53 construction sector, and having prior experience in OSC was not mandatory. Similar  
54 studies, such as those by Marinelli et al. (2022), chose these requirements based on  
55 low OSC adoption rates. Although participants’ experience was reported in the  
56  
57  
58  
59  
60 248 low OSC adoption rates. Although participants’ experience was reported in the

1  
2  
3 249 construction industry generally, all participants were familiar with OSC concepts  
4 (e.g., precast elements). Therefore, given that OSC in Jordan is still in its infancy,  
5 general construction experience served as a reasonable proxy for relevant  
6 experience.  
7  
8 252

9  
10 253 A purposive non-probability sampling technique was employed because it was  
11 difficult to determine the exact number of construction professionals in Jordan. The  
12 snowball sampling technique was used in numerous OSC-related studies due to the  
13 global spread and the absence of sampling frames (Guribie et al., 2022; Mao et al.,  
14 2018. The impracticability of probability-based approaches in construction research  
15 was another factor, which could result in an unreasonably low response rate  
16 (Abowitz & Toole, 2010). Hence, snowball sampling was the most practical  
17 technique to achieve sufficient responses from construction professionals. The  
18 questionnaire was administered online to mitigate the biases often associated with  
19 in-person surveys. A total of 208 responses were collected from 04/May/2023 to  
20 20/July/2023. The respondents were asked to rate the importance of each indicator  
21 in Table 1 on a 5-point Likert scale, ranging from extremely unimportant to extremely  
22 important. The demographic profile of the respondents is summarised in Table 2.

50 The data was analysed using SPSS v29. Exploratory Factor Analysis (EFA) was  
51 conducted to assess the distribution of the variables among the four proposed  
52 factors (i.e., economic barriers, social barriers, environmental barriers, and OSC  
53 adoption) as a researcher may determine a specific number of groups based on  
54 previous research or theoretical considerations (Hair et al., 2011; Hwang & Choe,  
55 2020; Leeman et al., 2022). Therefore, the researcher forced the number of factors  
56 to four and embraced Principal Component Analysis (PCA) and Varimax rotation  
57 techniques to perform the analysis. Factor loadings greater than 0.4 indicated  
58 significant relationships between the extracted components. Cronbach's alpha,  
59 Kaiser-Meyer-Olkin (KMO), and Bartlett Test of Sphericity were employed to assess  
60 the reliability of the extracted factors.

## 50 **Results and Analysis**

1  
2  
3 279 The four extracted groups in Table 3 explained approximately 65% of the variation.  
4  
5 280 Five variables played multiple roles and contributed to two components, indicating a  
6 complex relationship between the foundational concepts. Rahman (2014) attributed  
7 the various roles of some barriers to OSC adoption to their interrelations, highlighting  
8 the need for a comprehensive and unified approach to address these barriers.  
9  
10 284 Moreover, the five cross-loading variables had communalities above 0.5, leading to  
11 disregarding their cross-loading (Kim & Im, 2023). Thus, these variables are not  
12 independent but have similarities corresponding with these unique elements.  
13  
14 286  
15  
16

17  
18 287 **\*\*\* INSERT TABLE III HERE \*\*\***  
19  
20

21 288 Cronbach's alpha test was performed to assess the reliability of the components.  
22  
23 289 With a minimum value of 0.779, the four components were considered to have  
24 acceptable to excellent internal consistency (George & Mallery, 2019). KMO and  
25 Bartlett Test of Sphericity were also conducted to examine the correlations among  
26 variables and their occurrence (Hair et al., 2018). A KMO value closer to one and the  
27 significance of the Bartlett Test of Sphericity indicate that a highly reliable scale is  
28 present. The results of these tests are summarised in Table 4.  
29  
30  
31 294  
32

33  
34 295 **\*\*\* INSERT TABLE IV HERE \*\*\***  
35  
36

37 296 After the exploratory factor analysis, the descriptive statistics for the variables  
38 analysed are presented in Table 5. These results include the number of  
39 respondents, as well as the mean and standard deviation. The analysis indicates  
40 that the most significant variable is the 'Lack of regulations, standards, and  
41 incentives' (mean = 4.09). Additionally, the lowest mean score is 3.77, which  
42 indicates that all variables are considered important in the context of OSC in Jordan.

## 51 303 **Discussion**

52  
53

54 304 The literature review and data analysis revealed the key barriers significantly  
55 influencing the adoption of OSC. The factor analysis rearranged the 23 variables  
56 based on the TBL of sustainability theory into four predefined groups: OSC adoption,  
57  
58  
59  
60

307 economic barriers, social barriers, and environmental barriers. The 23 variables are  
 308 grouped as shown in Figure 1.

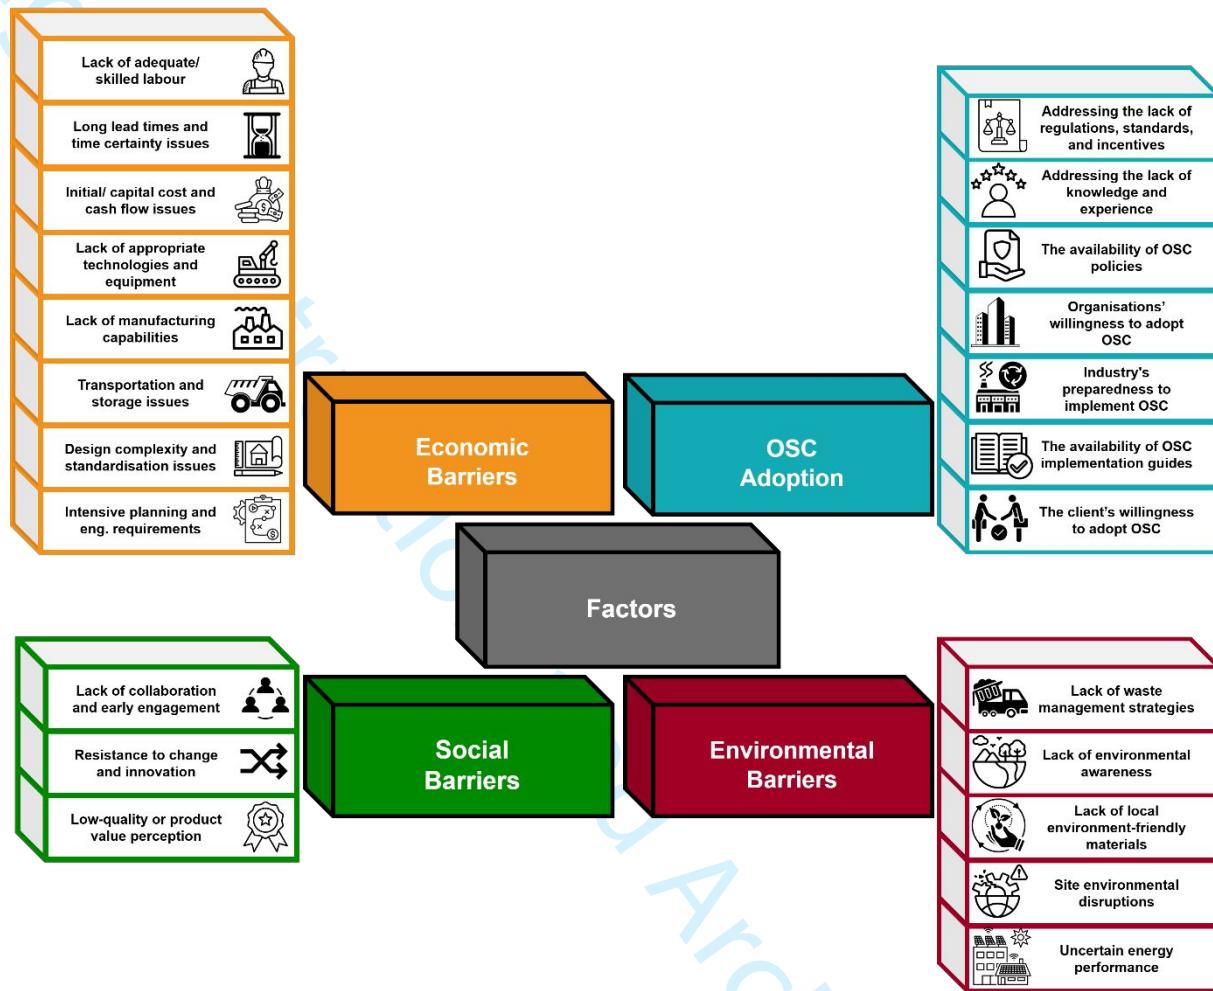

Figure 1: Results of Factor Analysis

### 311 *Economic Barriers*

312 The first factor, named economic barriers, has eight barriers. The initial/capital cost  
 313 and cash flow issues barrier is considered a substantial barrier to OSC adoption in  
 314 Jordan. One reason for this is the interdependency of construction sectors with  
 315 countries' financial aspects (Dabirian et al., 2023). This is also closely linked to the  
 316 complexity of decision-making and the extensive planning and engineering  
 317 requirements. Another economic barrier is the intensive planning and engineering  
 318 requirements that are intertwined with social barriers and concerns about integration  
 319 and early engagement of all parties. This is supported by Gibb and Isack (2003),  
 320 who asserted that OSC might not be effective without the early engagement of the  
 321 suppliers and design freeze. This means that addressing the economic barriers

1  
2  
3 322 requires a comprehensive approach that integrates both economic and social  
4 challenges.  
5  
6

7 324 Another important economic aspect is the late freezing of design, which is integral to  
8 the design complexity and standardisation issues barrier. This is because it can then  
9 result in client satisfaction and trust issues. This confirms that freezing design early  
10 is a considerable advantage of OSC (Tam et al., 2007). This is crucial in the  
11 Jordanian context, as design changes are significantly affected by client  
12 requirements and design errors (Gharaibeh et al., 2020). The design time and design  
13 freezing sub-variables also correlate with the long lead times and time certainty  
14 issues barrier, as OSC has different relationships and concurrencies between  
15 construction activities compared to traditional construction methods. Wuni and Shen  
16 (2019) reported similar findings when they found that the design variable is highly  
17 correlated with time and quality variables. Hence, addressing design-related barriers  
18 ultimately leads to more accurate project timelines and improves OSC outcomes.  
19  
20

21 336 The lack of manufacturing capabilities also adds to the economic group of barriers.  
22 337 Establishing manufacturing capabilities requires significant investment and evidence  
23 of achieving economies of scale. Another reason for the lack of manufacturing  
24 capabilities is the lack of appropriate technologies and equipment, as implementing  
25 OSC methods requires a sophisticated integration of various technologies and  
26 manufacturing techniques (Goulding et al., 2023). In Jordan, this is closely linked to  
27 the slow technological adoption, as the country lacks experience and is suffering  
28 from high training and software costs (Hyarat et al., 2022). Moreover, transportation  
29 and storage issues exacerbate the integration of technologies and manufacturing  
30 techniques by restricting the dimensions of the transported elements and the ability  
31 to store them. This is particularly common in developing countries, where logistical  
32 solutions are more challenging (Jiang et al., 2018). Therefore, investments in  
33 advanced technologies and strategic planning are essential for addressing logistical  
34 challenges, particularly in developing countries.  
35  
36

37 350 Furthermore, although OSC is well-known for addressing labour shortage issues, the  
38 lack of adequate labour compounds challenges to adopting OSC. This is because  
39 OSC demands more expertise from workers than traditional construction methods  
40 (Almutairi et al., 2017). This considerably constraints timelines and productivity rates,  
41  
42

1  
2  
3 354 affecting projects' total costs. Hence, adopting a strategic approach to optimising  
4 resource allocation and streamlining processes in Jordan's OSC landscape is  
5 essential to addressing the economic barriers and enhancing sustainability.  
6  
7  
8  
9 357 *Social Barriers*  
10  
11  
12 358 The second factor, social barriers, included three barriers: quality perception,  
13 resistance to change, and collaboration issues confronting the OSC sector. The low-  
14 quality or product value perception barrier can be attributed to the negative  
15 experience left by previously executed OSC projects that were poorly managed. This  
16 negative image from past failures makes it more challenging to assess OSC's  
17 superiority, contributing substantially to resistance to change and innovation.  
18  
19 362 Addressing these barriers demands well-defined strategies addressing low-value  
20 perceptions and a culture of cooperation (Nadim & Goulding, 2011). Furthermore,  
21 the literature review suggested that early collaboration would mitigate several  
22 barriers to OSC adoption. For instance, Ezcan and Goulding (2022) revealed that a  
23 change in the overall mindset is essential for the sustainability of OSC. This is also  
24 consistent with that of Thneibat and Al-Shattarat (2021), who found that client  
25 support and team environment are key to value management processes in Jordan.  
26  
27 367 Thus, it is imperative to increase stakeholder cooperation and publicise OSC's  
28 quality advantages to increase its adoption.  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39 373 *Environmental Barriers*  
40  
41  
42 374 The third factor constitutes environmental barriers. Addressing these barriers to OSC  
43 adoption is critical for sustainable development. In this context, the lack of  
44 environmental awareness leads to neglecting sustainable practices. On the other  
45 hand, boosting such awareness drives OSC markets to be more mature (Yuan et al.,  
46 2022). Also, the lack of waste management strategies leads to increased  
47 environmental degradation, worsening the adverse environmental impact of  
48 construction. While OSC produces a smaller amount of waste compared to  
49 conventional on-site construction (Kamali & Hewage, 2017), inadequate waste  
50 management strategies can lead to higher disposal expenses and potential  
51 environmental damage. These barriers reflect a wider issue in Jordan, where  
52 environmental principles are less emphasised in government construction projects  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 385 (Ayoub et al., 2023). Therefore, enhancing environmental awareness and  
4 implementing effective waste management strategies are essential steps towards  
5 fostering a more sustainable and mature OSC market.  
6  
7

8  
9 388 The uncertain energy performance calls into question the long-term sustainability  
10 efficiency of OSC projects. This finding is consistent with that of Wuni and Shen  
11 (2020), who found that the uncertainties about the energy performance of OSC  
12 projects are an important technical barrier. Moreover, while the limited availability of  
13 local eco-friendly materials increases emissions and transport costs, it can also  
14 contribute to site disruptions during OSC activities. Hence, addressing these barriers  
15 provides myriad advantages for the Jordanian construction industry, as it can lead to  
16 significant economic and social benefits.  
17  
18

19 396 *OSC Adoption*  
20  
21

22  
23 397 The fourth factor is OSC adoption, which covers the variables that affect the mindset  
24 of the industry in adopting OSC methods. Interestingly, it is deemed that addressing  
25 the lack of knowledge, experience, and the lack of regulations, standards, and  
26 incentives is a prerequisite to adopting OSC rather than a barrier. This result  
27 provides additional support for the perception that knowledge and experience are  
28 essential for the efficient management of OSC projects (Ginigaddara et al., 2023;  
29 Jang et al., 2021). By recognising these aspects as foundational prerequisites,  
30 stakeholders can focus on enhancing other variables, smoothening a sustainable  
31 OSC adoption in the Jordanian construction industry. The importance of addressing  
32 the lack of regulations, standards, and incentives is further underlined by being the  
33 most crucial variable affecting OSC adoption in Jordan.  
34  
35

36 408 The other five variables, namely, the client's willingness to adopt OSC, the  
37 organisation's willingness to adopt OSC, the availability of OSC policies, the  
38 availability of OSC implementation guides, and the industry's preparedness to  
39 implement OSC, are in line with previous results (Guribie et al., 2022). In this  
40 context, Goulding et al. (2012) emphasised the need to retrain construction  
41 professionals and clients to adopt a fresh mindset. Such a new mindset can  
42 maximise the potential of realising OSC's advantages and help overcome the  
43 challenges associated with its adoption. This demonstrates that creating a proactive  
44  
45

1  
2  
3 416 mindset and empowering both professionals and clients with the requisite knowledge  
4 417 and resources are critical to improving OSC adoption in Jordan. As a result, the  
5 418 benefits of OSC can be realised, positioning the sector better to address associated  
6 419 barriers.  
7  
8  
9

10  
11 420 **Conclusion**  
12  
13

14 421 This study aimed to identify the barriers to adopting OSC in Jordan through a  
15 422 sustainability-based perspective, employing the TBL sustainability framework. By  
16 423 collecting data from 208 construction professionals in Jordan and applying EFA, the  
17 424 study refined global variables into four context-specific factors: OSC adoption,  
18 425 economic barriers, social barriers, and environmental barriers. These factors  
19 426 illustrate how the pillars of sustainability are shaping the adoption of the OSC in the  
20 427 Jordanian context. A notable finding is that Jordanian construction professionals  
21 428 view addressing the absence of regulations, standards, and incentives, and the  
22 429 absence of knowledge and experience as essential requirements for OSC adoption  
23 430 rather than barriers to it, underscoring a proactive stance within the industry.  
24 431 Moreover, the statistical analysis revealed that the most crucial variable affecting  
25 432 OSC's adoption was the lack of regulations, standards, and incentives. The second  
26 433 and third most important variables were the lack of adequate labour and long lead  
27 434 times and time certainty issues, respectively. Among other variables, the least  
28 435 essential variable was addressing the uncertainty of energy performance.

59  
60

436 The research recognises the importance of addressing economic barriers, given the  
437 cost-driven nature of construction industry decisions. The results confirm that the  
438 economic barriers are the most prevalent sustainability-based barriers to OSC  
439 adoption in Jordan. Hence, optimising resource allocation and implementing value  
440 management practices are crucial for addressing these barriers. Also, adopting a  
441 new mindset that allows for early collaboration between stakeholders to ensure  
442 smooth process coordination is key to realising the advantages of OSC and helping  
443 address the barriers to its adoption. Furthermore, enabling a culture of early  
444 stakeholder collaboration is essential for improving process coordination and  
445 leveraging the benefits of OSC, which supports the social component of the TBL  
446 framework.

1  
2  
3 447 Overall, this research achieves its aim by providing a clear understanding of  
4 448 sustainability-related barriers to OSC adoption in Jordan and by offering practical  
5 449 insights to improve its uptake. The insights gained from this research should assist  
6 450 Jordanian construction organisations in understanding the fundamental requirements  
7 451 for sustainable OSC adoption. The study significantly contributes to the  
8 452 understanding of OSC adoption, as previous research has not identified these  
9 453 factors within the Jordanian OSC sector. Although the findings of this research are  
10 454 significant, its reliance solely on data collected from Jordan limits the generalisability  
11 455 of these findings. Hence, future studies should expand the research to include  
12 456 various geographical contexts and explore additional factors that may impact OSC  
13 457 adoption across different regions. Such an approach would offer a broader  
14 458 understanding of the challenges and opportunities related to OSC, helping to  
15 459 formulate more effective strategies for promoting sustainable construction practices  
16 460 globally.

**Authors responses to Reviewers' comments received on 6<sup>th</sup> December 2025****Manuscript ID ECAM-04-2025-0601.R1****Editor:**

This reviewer(s) have some important comments that would further improve the quality of the paper and should therefore be addressed within a minor revision.

**Authors' response:**

Many thanks to the Editor and Reviewers for their time and effort in reviewing this study. We trust the revisions made to the manuscript can now justify its publication in this esteemed journal.

**Reviewer 1**

Reviewer's Comments	Authors' Response
The authors have responded satisfactorily to my comments.	<i>Thank you. We appreciate your time and constructive feedback, which improved the quality of the manuscript.</i>

**Reviewer 2**

Reviewer's Comments	Authors' Response
The revised version of the manuscript has improved. However, further improvement is still required.	<i>Thank you for your continued review. We have carefully revised the manuscript accordingly to enhance its quality and clarity.</i>
The authors should describe how the feedback from the five-plot survey was used to improve the questionnaire. Also, they should provide a copy of the questionnaire and a copy of the ethical approval letter.	<i>Thank you for this constructive comment. We have added the following clarification to the manuscript:</i>  <i>"This pilot survey was conducted to ensure the relevance and clarity of the questionnaire. Feedback indicated that some items were ambiguous or wordy. For example, separate items addressing long lead times and time certainty were consolidated into a single item to reflect their correlation in practice. Therefore, the item was refined to "Reducing lead times and improving time certainty" to better capture schedule reliability and efficacy. The refinements enhanced the overall flow and clarity of the questionnaire."</i>  <b><i>(See Lines 234 to 240)</i></b>

	<p>Also, the questionnaire is now provided as a supplementary file (The cover letter of the questionnaire has been omitted).</p> <p>The ethical approval letter has been uploaded separately as a “not for review” document to allow editorial verification while preserving participant and institutional anonymity.</p>
<p>From the result presented the respondent years of experience in OSC is not clear. It only shows their years of experience in the construction industry. This is confusing and a great concern. Did the author assume everyone in the Jordan construction industry knows OSC? They should explain why the OSC population in Jordan cannot be determined.</p>	<p>Thank you for this comment. We acknowledge that respondents' experience was reported for the construction industry in general rather than specifically in OSC. This approach follows previous studies, such as Marinelli et al. (2022), which surveyed all construction professionals due to the low adoption of OSC. As noted by Marinelli et al. (2022): “Participants were allowed to complete the survey even if they did not have experience in OSC, as long as they confirmed that they had knowledge of the relevant concept and applications of any kind (e.g., precast elements, volumetric, modular etc). This was considered a reasonable requirement given the very low actual OSC implementation and experience of the sector.”</p> <p>We did not assume that all respondents have direct OSC experience; however, as construction professionals familiar with the concept of OSC, they can provide their perceptions on the barriers affecting its adoption. Because OSC is still emerging in Jordan, the total population of OSC professionals is not clearly defined, making general construction experience a reasonable proxy for relevant expertise.</p> <p>In response, we have added this clarification to the manuscript to improve transparency.</p> <p><b><u>(See lines 246 to 252)</u></b></p>

The end. Thank you.

**1. General Information**

1.1 What is your nature of business in construction? \*

1       Academic       Client       Consultant  
2       Contractor       Manufacturer       Other: .....

3      1.2 What is your current role in construction? \*

4       Company Manager       Project Manager       Construction Manager  
5       Office Engineer       Site Engineer       Other: .....

6      1.3 How many years of experience do you have in the construction industry?

7       0-4       5-9       10-14       15- 19       20 or more

8      1.4 What is your level of education in construction?

9       No degree       Diploma       Bachelor's Degree  
10      Master's Degree       Doctoral Degree

11     1.5 What are the types of offsite construction that you have experience in? (choose all  
12     applicable)

13      None  
14      Components (such as trusses, staircases, columns, and beams)  
15      Panels (such as precast floors, walls, ceilings, and roof panels)  
16      Foldable structures (building panels connected using hinges)  
17      Pods (repetitive parts such as kitchens, bathrooms, and prison pods)  
18      Modules (non-repetitive parts of a whole building)  
19      Complete (modular) buildings

20     1.6 How important to you is the use of offsite construction in Jordan?

21     **1= Extremely Unimportant, 2= Unimportant, 3= Neither Unimportant Nor  
22     Important, 4= Important, 5= Extremely important**

1	2	3	4	5

1  
2  
3 **Based on your knowledge/ experience, to what extent is the following item**  
4 **important to increase offsite construction adoption in Jordan?**  
5  
6

<b>2. Economic-related Barriers</b>		1	2	3	4	5
<b>1= Extremely Unimportant, 2= Unimportant, 3= Neither Unimportant Nor Important, 4= Important, 5= Extremely important</b>						
2.1	Addressing initial/ capital cost and cash flow issues					
2.2	Reducing lead times and improving time certainty					
2.3	Providing appropriate technologies and equipment (such as cranes)					
2.4	Having transportation and storage solutions/ plans					
2.5	Addressing design complexity and standardisation issues					
2.6	The availability of manufacturing capabilities (including the ease of supply and delivery)					
2.7	The mitigation of the intensive planning and engineering requirements					
<b>3. Social-related Barriers</b>						
3.1	Having offsite construction knowledge and experience					
3.2	The availability of an adequate/ skilled labour force					
3.3	The acceptance to change and innovation					
3.4	Changing the perception of low-quality/ product value					
3.5	Stakeholders' collaboration and early engagement					
3.6	The availability of governmental regulations, standards, and incentives					
<b>4. Environmental-related Barriers</b>						
4.1	Increasing the focus on/ awareness of environmental sustainability					
4.2	Having effective waste management strategies					
4.3	The availability of local and environment-friendly materials					
4.4	Improving the certainty of energy performance and efficiency					
4.5	Reducing site access environmental disruptions (such as disturbance, noise, and congestion)					
<b>5. Offsite Construction Adoption</b>						
5.1	Client's willingness to adopt offsite construction					
5.2	Construction organisations' willingness to adopt offsite construction					
5.3	The availability of offsite construction policies					
5.4	The availability of guides to implement offsite construction					
5.5	The construction industry's preparedness to implement offsite construction					
<b>6. Offsite Construction Organisational Maturity</b>						
6.1	Accurately informing the staff of a clear and specific offsite construction process					
6.2	Predicting and monitoring the quality of products					
6.3	Having clear organisational roles and responsibilities					
6.4	Having consistent requirements and effective execution strategies for offsite construction					
6.5	The availability of objective and quantitative methods to analyse offsite construction process problems					
6.6	Updating offsite construction data based on previous performance
